Animal Waste Management

Bill Errickson
Agriculture Agent
Rutgers Cooperative Extension of Monmouth County
Animal Waste Management

The goal of animal waste management is to make best use of the nutrients in manure while protecting natural resources.

When managed properly, manure can be a valuable resource on a farm. It can be a source of nutrients for crop production and can improve soil quality. However, if there is insufficient land to use the amount of manure that is produced or if manure is mismanaged, then risks to water supplies and the environment could result.

New Jersey Requirements

The State of New Jersey requires that all livestock farms proactively address and manage non-point source pollution that may originate from livestock operations. All livestock producers must meet the requirements of the Animal Waste Management Rule. See Agricultural Management Practices to learn more.

As a result of this rule many New Jersey livestock farmers are required to develop Animal Waste Management Plans (AWMPs). For assistance in completing an AWMP please contact your local County Extension office.

Educational Meetings

Rutgers Cooperative Extension will provide educational support for those needing to complete AWMPs. Educational meetings around the state about Animal Waste Management Plans (AWMPs) will be scheduled as needed. Please contact local County Extension office for assistance.

https://njaes.rutgers.edu/animal-waste-management/
NJ Animal Waste Management Rules

• The New Jersey Department of Agriculture (NJDA) was authorized by the Legislature to develop Criteria and Standards for Animal Waste Management (NJAC 2:91). The NJDA has developed rules to proactively address non-point source pollution that may originate from livestock operations.

• All agricultural animal operations must follow the General Requirements of the rules within 12 months of establishment.
General Requirements of the Rules

1. Agricultural animal operations shall not allow animals in confined areas to have uncontrolled access to waters of the state.
2. Manure storage areas shall be located at least 100 linear feet from waters of the state.
3. Land application of animal waste shall be performed in accordance with the principles of the NJDA Best Management Practices (BMP) Manual.
4. Dead animals and related animal waste resulting from a reportable contagious disease or an act of bio-terrorism shall not be disposed of without first contacting the State Veterinarian.
5. Any person entering a farm to conduct official business related to these rules shall follow bio-security protocol.
Who Must Complete an Animal Waste Management Plan?

• All Farms must follow the Animal Waste Management Rules
• AWMP not required for:
  • 1-7 Animal Units (AU*) – A self-certified AWMP is encouraged but not required
  • Receiving Manure < 142 tons of manure per year – A self-certified AWMP is encouraged but not required
• Self-certified AWMP required for:
  • 8-299 AUs w/densities < 1AU/acre
  • Receiving Manure > 142 tons of manure per year
• AWMP must be reviewed by a conservation professional for:
  • 8-299 AUs w/densities > 1AU/acre
• Comprehensive Nutrient Management Plan (CNMP) must be certified by NJDA for:
  • 300+ AUs, regardless of density
  • * 1 AU = 1,000 pounds of live animal weight
How Many Animals in an Animal Unit?

Frequently Asked Questions

Do the rules require any permits?
No. However, farms with 300 or more AUs are required to be certified by the NJDA. The NJDA will issue a certification once the required CNMP is approved by the district and submitted to the NJDA.

Do the rules require any fees?
No. There are no fees involved with these rules.

Are there any penalties for rule violations?
Yes, there are penalty provisions in the rules. When non-compliance is found, the NJDA may allow the owner/operator up to 60 days to take corrective action. The NJDA will consider the seriousness of the violation, the conduct of the operator and the type of plan required when determining penalties.
An animal waste management plan consists of information about manure production, storage, and use.

Manure can be disposed off site.

All manure remaining on the farm should be spread according to a plan that distributes nutrients in manure on land according to the uptake rate of the various crops or grasses on the farm.
The goal of animal waste management is to make best use of the nutrients in manure while protecting natural resources.

When managed properly, manure can be a valuable resource on a farm. It can be a source of nutrients for crop production and can improve soil quality. However, if there is insufficient land to use the amount of manure that is produced or if manure is mismanaged, then risks to water supplies and the environment could result.
## Animal Unit Equivalents and Manure Production

All Values Calculated from Midwest Plan Service - MWPS-18, 2000 (by the American Society of Agricultural Engineers)

Note: Animals not identified in the list shall be calculated based on species, production goals, breed or accepted species weights as determined by RCE.

Manure Handling and Management

- Each farm should have a plan for managing manure including collection, storage, spreading, and disposal. To reduce the amount of manure runoff, cover stockpiled manure and bedding, especially during high rainfall periods. Direct all ‘clean’ roof runoff and land runoff away from animal barnyards or pastures.

- Collect and store untreated runoff and seepage from manure storage areas
- Store manure and bedding waste before it is spread on fields
- Apply and incorporate manure; spreading rates to be determined by soil testing results
- Manure should not be spread on fields when soil is frozen; soil should be firm enough to prevent tractors and spreaders from packing the soil, and dry enough to avoid manure runoff
- Allow manure to be applied to pastures or crops to meet the plants’ fertilizer needs; to prevent seepage into underground water supplies, avoid applying too much manure
- Manure can be disposed off site where it will be beneficially utilized
Where to Store Manure

Store manure in a dry, level, impermeable location, free from storm-water runoff, and out of the food plain. Manure can be composted for better use as a soil amendment.

- Structure with a cover or roof
- Tarp may provide cover with less cost and more labor
- Stack or stockpile in a well-drained area for later hauling
- Drainage from storage should be channeled into a vegetative buffer
- Regulations may require runoff controls
Stormwater Management

• Rainfall can generate significant runoff around your facility that can run off into water bodies and/or produce mud. By implementing some simple stormwater management practices, you can reduce the potential for non-point source pollution and negative water quality impacts. A significant amount of runoff can be diverted away from barnyards, manure storage areas and stall areas reducing the potential for animal waste to be washed away. Several ways to manage stormwater runoff are:

• Install gutters, down spouts and splash blocks on all animal barns and shelters
• Divert all ‘clean’ water away from ‘manure areas’
• Maintain roof gutters/downspouts to flow away from buildings
• Add drains, underground outlets and berms where needed
• Install diversions that direct stormwater containing manure into vegetative buffer areas
• Separate manure storage areas from ‘clean water’ areas with grass buffer strips
Preparing a Digital Report
You can prepare your report right from your computer. Just download the file below, unzip it, and double-click on the RutgersAWMPReportCreator.exe file.

RutgersAWMPReportCreator.zip (95MB)

Preparing a Paper Copy Report
The book *On-Farm Strategies to Protect Water Quality* will describe how to prepare an Animal Waste Management Plan (AWMP). It will also include an example of a template for you to follow in preparing your plan.
On-Farm Strategies to Protect Water Quality

An Assessment and Planning Tool for Best Management Practices on New Jersey Farms

Animal Waste Management

The New Jersey Department of Agriculture maintains Animal Waste Management regulations. All livestock farms, which includes equine operations, are required to follow the 5 General Requirements:
1. Animals in confinement areas shall only have controlled access to waters of the state;
2. Manure storage areas must be 100 feet from waters of the state, and, on slopes less than 2 percent;
3. Land application of manure must follow Best Management Practices;
4. Livestock contagious disease must be reported to the State Vet.; and
5. State Officials must follow bio-security protocols.

Furthermore, farms with 8 or more Animal Units (1 Animal Unit equals 1,000 pounds), or which import 142 Tons of manure are required to develop and implement an Animal Waste Management Plan (AWMP). For more information please see the links and FAQs below. For assistance please contact NJOA Division of Agricultural and Natural Resources (Phone: 609-913-6492), or your local Rutgers Cooperative Extension Office.

  - Includes AWMP instructions on pages 16-22 and the AWMP template on pages 73-107

Prepared by the New Jersey Association of Conservation Districts in Cooperation With:
- State Soil Conservation Committee, New Jersey Department of Agriculture
- Natural Resources Conservation Service, U.S. Department of Agriculture
Preparing Your Animal Waste Management Plan

Before You Start
There are a number of things that you should do before you start completing your plan.

1. Conduct soil tests for any fields on your farm where you plan to spread manure (not actually required by the rule)
2. Sample the nutrient content of the manure in your manure storage or estimate the nutrient content based on published values.
3. Determine the slope of your fields.
4. Prepare a farm map.
5. Determine how many animals you have and how much they weigh.
6. Estimate the amount and type of bedding you use.
7. Find phone and address of your local Public Health officials.

- Sensitive Areas
Questions to Answer

• **Manure Storage**
  
  • What is the distance of your manure storage to the nearest open water or wetlands? (<100 Feet)
    
    Distance of manure storage from property line: (<50 Feet)
    
    Distance of manure storage to nearest resident: (<200 Feet)

• **Barnyard Waste:**
  
  • If storm water is contaminated by barnyard manure, silage, wastewater or feed waste, does it have access to nearby waters?

• **Stream Access**
  
  • Do your animals have access to streams, lakes or other open waters on your farm? Are streams, lakes, and other open waters essential on your farm for livestock water consumption?

• **Field Evaluation**
  
  Do you spread manure on frozen ground during winter months on this field?
<table>

Submitting Your Report

• Your report is confidential.

• A Declarations page should be submitted to your Cooperative Extension office.

• Your local office does not evaluate or review your plan, but will record that you have completed it.

• File it for safe keeping.

• If you have more than 1 AU/acre you will have to have your plan reviewed by a conservation professional. Please contact your local Soil Conservation District for assistance.
Remember...

- All Farms must follow the Animal Waste Management Rules
- AWMP not required for:
  - 1-7 Animal Units (AU*) – A self-certified AWMP is encouraged but not required
  - Receiving Manure < 142 tons of manure year – A self-certified AWMP is encouraged but not required
- Self-certified AWMP required for:
  - 8-299 AUs w/densities < 1AU/acre
  - Receiving Manure > 142 tons of manure year
- AWMP must be reviewed by a conservation professional for:
  - 8-299 AUs w/densities > 1AU/acre
- Comprehensive Nutrient Management Plan (CNMP) must be certified by NJDA for:
  - 300+ AUs, regardless of density
- * 1 AU = 1,000 pounds of live animal weight
Thank you!
